Peptide Receptor Radionuclide Therapy using 177Lu octreotate Buy Practical guidance on peptide receptor radionuclide therapy (PRRRT) in neuroendocrine tumours (IAEA human health series) by International Atomic Energy Agency. 

Practical Guidance On Peptide Receptor Radionuclide Therapy (PRRRT) in neuroendocrine tumours (IAEA human health series). IAEA, Nuclear Medicine Section, Div. of Human Health, Vienna, Peptide Receptor Radionuclide Therapy (PRRRT) Practical Guidance on Peptide Receptor Radionuclide Therapy (PRRRT) for Neuroendocrine Tumours. IAEA Human Health Series. English STI/PUB/1560. Practical guidance on peptide receptor radionuclide therapy (PRRRT) in neuroendocrine tumours. Peptide Receptor Radionuclide Therapy (PRRRT) is a molecular therapy (also called radionuclide therapy or PRRT) that targets specific receptors on the surface of cancer cells.

The role of peptide receptor radionuclide therapy (PRTT) in the management of neuroendocrine tumors is well established. It is a targeted form of radiotherapy that delivers a high dose of radiation to the tumor while minimizing exposure to healthy tissue. This therapy uses a radiopharmaceutical that is labelled with a positron-emitting radionuclide, which allows for imaging and dosimetry planning. The radiopharmaceutical binds to somatostatin receptors on the surface of neuroendocrine tumor cells, enabling the delivery of localized high doses of radiation.

Practical guidance on peptide receptor radionuclide therapy (PRRRT) in neuroendocrine tumours, directed by IAEA, EANM, and SNMMI.

**Guideline/s:** Neuroendocrine tumours; Peptide receptor radionuclide therapy
